Wave Equation with Wentzell's Boundary Condition
and a Related Semigroup on the Boundary

By Tadashi Ueno

The College of General Education, University of Tokyo

Here, the problem is to solve the wave equation

$$(1) \quad \frac{\partial^2 u}{\partial t^2}(x) = Au(x), \quad x \in D$$

on a compact domain \bar{D} , with Wentzell's boundary condition

$$(2) \quad \begin{aligned} Lu(x) = & \sum_{j=1}^{N-1} \alpha_{ij}(x) \frac{\partial^2 u}{\partial \xi_i \partial \xi_j}(x) + \sum_{i=1}^{N-1} \beta_i(x) \frac{\partial u}{\partial \xi_i}(x) + \gamma(x) + \delta(x)Au(x) \\ & + \int_{\bar{D}} (u(y) - u(x) - \sum_{i=1}^{N-1} \frac{\partial u}{\partial \xi_i}(x) \xi_i(x, y)) \nu(x, dy) = 0, \quad x \in \partial D, \end{aligned}$$

which is, in a sense, the most general boundary condition for diffusion equation. The solution is given as a group of operators on a function space.

Another group of operators is obtained, which corresponds to

$$(3) \quad \frac{\partial^2 \varphi}{\partial t^2}(x) = \overline{LH} \varphi(x), \quad x \in \partial D,$$

where \overline{LH} is a closure of $LH : (LH)\varphi(x) = L(H\varphi)(x)$. Here, $H\varphi(x)$ is the solution of the Dirichlet problem $Au(x) = 0$, $x \in D$, with the boundary condition $u(x) = \varphi(x)$, $x \in \partial D$.

Equation (3) is expected to describe the wave propagation through the boundary with mass distribution $\delta(x)dx$ and the vibration term $\sum_{j=1}^{N-1} \alpha_{ij}(x) \frac{\partial^2}{\partial \xi_i \partial \xi_j}$ of the boundary.

The concrete results are contained in the article with the same title in Proc. Japan Acad., vol. 49, 1973.
